

Phase 3: Features of Computer Vision Workloads

1. Image Classification vs. Object Detection

Image Classification: Analyzing an image to determine the main subject or category of the image. (e.g., "This is an apple").

Object Detection: Identifying and locating multiple objects within an image by drawing bounding boxes around them.

2. Azure AI Vision (Optical Character Recognition - OCR)

OCR (Optical Character Recognition): A feature that detects and extracts printed or handwritten text from images.

3. Azure Custom Vision

Custom Vision: An Azure service that allows you to train your own custom image classification or object detection models using your own uploaded images.

4. Azure AI Face (Face Service)

Face Service: AI algorithms that detect, recognize, and analyze human faces in images (including attributes like facial landmarks or identity verification).

5. Azure AI Document Intelligence (formerly Form Recognizer)

Document Intelligence: A service that uses machine learning to extract text, key-value pairs, and table data from structured documents like receipts, invoices, and ID cards.
