

Phase 1: AI Workloads and Considerations

1. Artificial Intelligence (AI) vs. Machine Learning (ML)

Artificial Intelligence (AI): A broad capability of software to imitate human behavior, including learning, reasoning, and problem-solving.

Machine Learning (ML): A specific subset of AI where data is used to train a model to make future predictions or decisions without explicit programming.

2. Deep Learning (DL)

Deep Learning (DL): A specialized subset of Machine Learning inspired by the human brain's neural networks, used for complex processing like image recognition and NLP.

Crucial Exam Topic: The 6 Guiding Principles of Responsible AI

I. Fairness: AI systems should treat all people fairly without discrimination based on gender, ethnicity, or other factors.

II. Reliability and Safety: AI systems must perform reliably and safely under expected and unexpected conditions.

III. Privacy and Security: AI systems must respect user privacy and secure confidential data from unauthorized access.

IV. Inclusivity: AI systems should empower everyone and engage people of all physical and cognitive abilities.

V. Transparency: AI systems should be understandable, meaning users should know how decisions are being made.

VI. Accountability: People who design and deploy AI systems must be accountable for how their systems operate.
